THE RUB COLLECTION

The ILSE JACOBSEN HORNBÆK RUB collection for AW17 is a mix of the beloved classics and new developments.

This season’s new designs continue to play and experiment with shapes and surfaces that are easily integrated in an everyday wardrobe. New handcrafted solutions have been developed to create an innovative and fashionable rain boot. As always, we are introducing new colours for our classic styles that are well coordinated with the overall look and colour story of our womenswear collection.

EXTRAS FOR YOUR RUB SELECTION

RUB OIL

By using the correct care products, you can prolong the life of your RUB Boot selection. The ILSE JACOBSEN HORNBAEK RUB Collection is made of more than 80% natural rubber. It has the characteristic, that the rubber keeps on breathing and behaving naturally. By treating the rubber with our silicone oil and sponge, you will help prevent the rubber from drying out.

This way your ILSE JACOBSEN HORNBAEK rain boots will keep you dry and fashionable for a long time.

SOFT FLEECE SOCK

SOCK 39 = RUB1
 SOCK 42 = RUB2
 SOCK 40= RUB15

100% Fleece
 Sizes S-L
 Available in CREME (I2000I) and BLACK (00I120).

3D INSOLE FOR COMFORT

The 3D structure of the soles provides perfect support for the feet and encourages correct body alignment. The soles improve comfort in any type of shoe or boot and are tailored to compliment the anatomy of women's feet.

3D insole
 Bamboo top cover, EVA shell and EVA Base. IJ3DSOLE.
 Sizes 35/36, 37/38, 39/40

BASIC TECHNICAL FACTS

Our handmade rain boots can withstand even the hardest torrential downpour.

The boots are made of 80% natural rubber, harvested from some of the most well known plantations in countries like Malaysia and Vietnam. We use only a small amount of modifiers and fillers, which are all controlled and adjusted to fulfil the highest standards.

Our rain boots are handmade and made of more than 28 different parts. The insulating EVA soles are made to resist temperatures from -40C to + 40C.

If the rain boots are subjected to higher temperatures, the vulcanisation that bonds the 28 parts of the boot degrades, compromising the waterproof effect of the boot. Our warranty does not cover rain boots that have been subjected to temperatures over +40 degrees celcius and under -40 degrees celcius.

The tread pattern construction of the EVA outsoles gives the rain boots a good grip. In addition to this, we have lined the boots with a warm inner sole, made of 60% viscose and 40% cotton. The unique inner lining is made of high quality yarn and the spinning and

carding process gives this textile a very unique ventilation capacity. EVA is Ethylene Vinyl Acetate, which is a chemical categorisation for the specific insulating, flexible and weather resistant foam rubber.

Our laces are 100% cotton, and can be adjusted to fit your legs perfectly.

Standard laboratory testing define the performance of these materials.

All rubber parts should be treated with our special RUB oil and other textile or leather parts should be treated with correct protection spray.

THE RAIN COLLECTION

The AW17 RAIN collection is about authentic rainwear styles and creative interpretations of trends, all performed in innovative and functional fabrics.

This season's colour palette embraces natural dark hues, contemporary brights and dusty pastels

BASIC TECHNICAL FACTS

Technical label

The ecorepel® hangtag

Double welding technology

Aqua Guard YKK Zippers

Waterproof and breathable membrane

A waterproof membrane is a thin layer placed between shell fabric and bonding that has lots of microscopic pores, which are big enough to allow water vapour (sweat) to be released, but small enough to stop water droplets getting in. TPU (Thermoplastic polyurethane) membrane is our preferred choice for our RAIN selection.

Water Pressure = W/P

Waterproof/breathable fabrics resist liquid water passing through, but allow water vapour to pass through. Their ability to block out rain and snow while allowing vapour from sweat to evaporate makes them ideal to use in the rain. Standard laboratory testing defines

the performance of these fabrics. Water resistance is measured by the amount of water pressure (in mm) a fabric can withstand before water seeps through. This is of course supported by taping and welding that closes the stitch holes of the garment.

Breathability = M/P

Breathability is measured by the amount of vapour (in g) that can pass through a square meter of fabric during a 24-hour period.

ILSE JACOBSEN HORNBAEK are continuously working towards a more sustainable production. As part of this ongoing process, we have integrated ecorepel® coating in our entire RAIN softshell collection, thus eliminating the use of fluorocarbons.

What is ecorepel®?

ecorepel® is a new finishing technology that ensures a high level of water and dirt repellence on textiles. The technology is environmentally sound, free from fluorocarbons and biodegradable.

What are the benefits of ecorepel®?

With the ecorepel® finish, fabrics acquire a very high level of water and dirt repellence (watery dirt). In addition, thanks to the high level of abrasion resistance, the finish is permanently retained, even with heavy-duty use and following frequent washing. ecorepel® is also very environmentally sound, as the textile finish is biodegradable and free from fluorocarbons.

What kind of care do our RAIN products with ecorepel® require?

Our raincoats with ecorepel® finish can be washed without difficulty in a washing machine. The finish can withstand at least 30 washes at 40°C. Even after considerable use and frequent washing, the finish remains permanently active. After washing, the function can be reactivated by tumble-drying. Therefore, use of textile waterproofing chemicals are not necessary.

Are our raincoats with ecorepel® technology breathable?

Yes. The breathability is retained as the paraffin chains wrap themselves around the individual fibres. The fibre interspaces are retained, and breathability therefore remains intact.

Is ecorepel® biodegradable?

Yes, ecorepel® is 80 – 100 % biodegradable in accordance with OECD 302 B. Substances that meet this standard are considered fundamentally biodegradable.

Is ecorepel® "fluorocarbon-free"?

Yes, ecorepel® is completely free of fluorocarbons and PFC, as it is manufactured on the basis of paraffins.

Welded seams

Heat fusion, also called heat welding, is a welding process used to join two different pieces of a thermoplastic - in our case, PU. This process involves heating both pattern parts simultaneously and pressing them together, by pressing a shaped welding form on top of the two fabric parts.

When done properly, the two pieces become indistinguishable from each other.

Aqua Guard YKK Zippers

We work only with the best developed technologies, even when we select our zippers. YKK is a market leader. Our waterproof zippers are YKK Aqua Guard. A two-way solution is selected to improve performance and reduce strain on the bottom end of the zipper.

Code of Conduct

Our Raincoats are proven 100% in compliance with IJH A/S Code of conduct & BSCI guidelines.
